# Emergency Housing in California

A Python data analysis project | 2020–2024

rows 22,739

variables 7

questions 3

Goal: understand how emergency housing use changed over time, where it was most concentrated, and how trailer deliveries matched requests.

# Project goal & research questions

- 01 How has the use of emergency housing rooms changed over time?
- 02 Which counties had the highest number of occupied emergency housing rooms?
- 03 How closely did trailer deliveries meet trailer requests?

Why it matters: the data helps summarize patterns in emergency housing support across California.

# Data source & methodology

## DATA

Source: California Open Data

Dataset: Housing Impact Data

Original size: 22,739 rows × 7 columns

Time period analyzed: 2020–2024

## METHODS

Python: pandas, matplotlib, seaborn

Cleaning: dates, counties, numeric conversion

Quality checks: duplicates, missing values, inconsistencies

Visualizations: line charts + bar chart

Transformation: extracted Year for time analysis

NaN values were kept when appropriate — missing does not automatically mean zero.

# Finding 1 — Emergency housing use fell over time

Question 1: How has the use of emergency housing rooms changed over time?

KEY IDEA

2020 shows the highest use.  
The trend declines sharply after 2020.  
By 2024, occupied rooms are much lower than at the start.

Conclusion: a clear downward trend.

# Finding 2 — Use was concentrated in a few counties

Question 2: Which counties had the highest number of occupied emergency housing rooms?

## KEY IDEA

Los Angeles County ranks first.  
San Francisco County ranks second.  
Totals drop substantially after the top two counties.

Conclusion: housing use was not evenly distributed.

# Finding 3 — Deliveries stayed below requests

Question 3: How closely did trailer deliveries meet trailer requests?

## KEY IDEA

Requested and delivered trailers move in the same direction.  
Delivered remains below requested every year.  
The gap becomes smaller in the later years.

# Conclusions & references

## CONCLUSIONS

1. Emergency housing room use declined strongly from 2020 to 2024.
2. Los Angeles and San Francisco recorded the highest totals.
3. Trailer deliveries followed requests but stayed below them.
4. Missing values were handled carefully instead of being treated as zero.
